Body Mount (Fits Traxxas® TRX-4M)

Caution

NEVER use angle/wire cutters, doing so may crack the mount

DO use hacksaws, metal files or sandpaper

Read all directions before starting. Always use proper safety gear to prevent injury.

1. Shape the mounts

- Download the shaping guide for your body: ViciousRC.com/Downloads.
- Print the template.
- Place the mount on the template you printed, check that the size of the mount matches the printed size.
- If the size matches continue to the next step. If the size does not match, change the scaling on your printer (In the print settings) and try again.
- Cut out the template and use it to transfer the shape onto the mounts.
- Sand and/or file the mounts thicker end to shape.

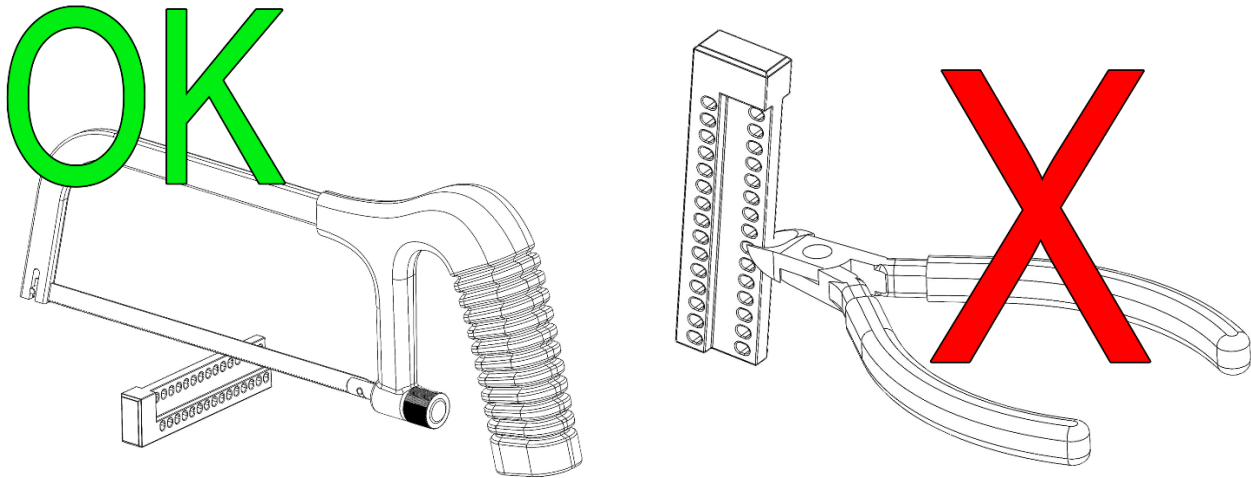

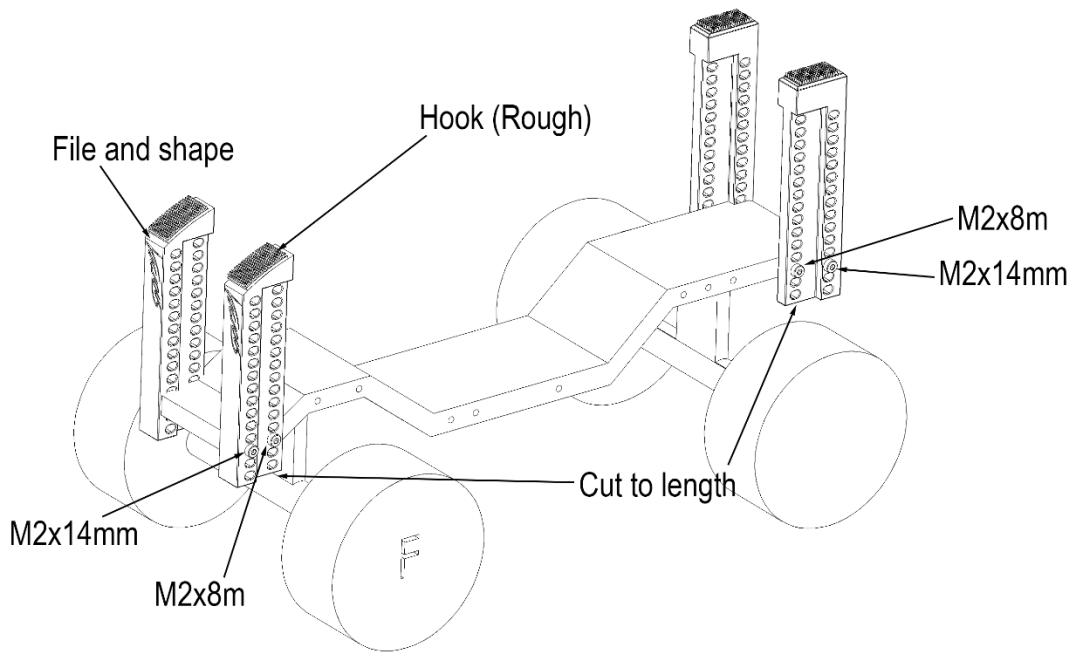

2. Determine the height and cut (Refer to picture on rear of this page)

- Remove the stock bumpers and wiring.
- Using the supplied screws attach the mounts, snug them, and do not overtighten. 8mm long for the furthest out holes, and 14mm for the inside holes.

- Place the body over the chassis and let it sit on the mounts. Adjust the mounts up/down until the desired height is achieved. Check for tire clearance when the suspension is fully collapsed.
- Mark the mounting screw locations. Remove the mounts. If you have clearance, leave 1-2 extra screw rows below your marked location. This will add strength and allow you to move the mounts up to accommodate larger tires.
- Use a hacksaw, metal file or sand to length. **Cut starting with the thinner side first as shown on the next page.**
- Re-attach the mounts to the chassis. The mounts should be snug to the chassis, do not overtighten.

3. Final Mounting – After Painting the body

Our product features VELCRO® Brand fasteners, hereafter referred to “hook and loop”

- Cut the hook and loop fastener pieces in half, creating 4 hook (Rough) and 4 loop (Soft) pieces.
- Clean the mount tops with rubbing alcohol and let the surface dry.
- Remove the adhesive backer from the hook fastener. Attach it to the top of the mounts, as centered as possible.
- Place the loop onto the hook side on top of the mounts.
- Remove the adhesive backer from the loop fastener.
- CAREFULLY place the body onto the mounts, take your time to align everything before allowing the loop fastener to touch the body. It might be easier to flip the body over and lower the chassis into the body.
- Once the body is in the correct position press firmly to permanently attach the loop fastener to the body
- The adhesive on the fastener is VERY strong do not try to remove/reposition it once applied. Additional hook and loop can be purchased at hardware stores, be sure to use a quality brand.
